## Cable Bus Design

*The Cable Bus concept is a low cost, maintenance-free, worry-free approach to power distribution.*

Today, after decades of impressive performance, cable bus has become a practical alternative to conventional non-segregated phase bar bus systems. Calvert **Cable Bus** has won the approval of many engineers and buyers because of its low cost, low maintenance, and high reliability. Cable Bus utilizes fully-rated power cables instead of the more traditional bus bars to carry current. The cables are housed in a ventilated metal enclosure (normally aluminum) to provide a completely protected bus system.

The Calvert Cable Bus is a "system", not just a product. Calvert takes great pride in its' ability to supply customers with the design, materials, terminations, connectors, supporting structures and accessories necessary to ensure a completely coordinated application. Of course, we offer complete installation and testing of the Cable Bus to complete the Calvert System.

## Almost any amperage with voltages up to 69kV

### Splice-free Custom Designed

The Calvert Company designs and engineers each cable bus system to meet specific job requirements. Calvert Cable Bus is not a product that can be purchased using catalog numbers, or out of a brochure, or from this web page. We design each system to operate within your projects' unique situation. Each system design must consider environmental, electrical, routing, shipping and installation factors to ensure reliable performance from the Calvert Bus System.

## ISO 9001-2000 Certified
